

An unrivalled architecture enabling the delivery of an exciting range of Managed Data Services **LANnet**

Network Services

- LANnet is a UK wide multi-gigabit IP network which passes through the majority of UK cities and metropolitan areas
- City Centre Points of Presence (POPs) facilitate the delivery of low cost communication links to customer sites up to a range of 25km from the POP
- The use of sophisticated network monitoring and management technologies, such as HP OpenView, Tivoli Storage Manager and Orchestream enable us to provide effective and flexible 24x7 support backed by a comprehensive SLA

LANnet utilises the latest technologies such as MPLS* and DWDM* to guarantee high performance and to provide the scalability and resilience lacking in traditional networks

- The network has been built using world class components including Cisco routing technology
- Direct or VPN Internet access can be provided anywhere on the network via multiple connections to global Tier 1 providers
- Data centres provide secure hosting for a range of managed services
- LANnet can be integrated with other networks and technologies to deliver connectivity ranging from ADSL to GB Ethernet, throughout the country.

* MPLS = Multi Protocol Label Switching

* DWDM = Dense Wavelength Division Multiplexing
